## **Abstract of Project**

This project is under the course code of INT 213 (Python Programming) offered by lovely professional University .This project deals with the application of Graphical User Interface modules available in python library to built a model of desktop application for the shop billing purposes.

This project uses the “tkinter” library available in python to make the complete user interface and will explore different functions available in the library to be used to make the interface user friendly and attractive.

It contains the separate modules for different functionality like Login, for purchasing the goods from the whole sellers , for selling the goods to the buyer, bill generation, etc. also taken care of. It also contains different sections for goods so that user can select different section of goods as per their wish.

At last, this project is just a demo application of how everything work on the billing application and there is a lot more thing to add in further future so to make it more detailed and good application for general use.

## Acknowledgements

In the present world of competition there is a race of existence in which those are having will to come forward succeed. Project is like a bridge between theoretical and practical working. With this willing I joined this particular project. First of all, I would like to thanks the supreme power of Almighty God who is obviously the one has always guided me to work on , the one has always guided me to work on the right path of life. Without his grace this project could not become a reality. Next to him are my parents, whom I am greatly indebted for me brought up with love and encouragement to this stage. I am feeling oblige in taking an opportunity to sincerely thanks my teacher “**Mr. Sagar Pande Sir**” department of computer Science and Engineering and mentors of Lovely Professional University who guided me towards doing this project of “Shop Billing Application” under the course code INT 213 as my course helped me to know the different aspects and utilization of Python programming Language in different purposes. I am highly obliged in taking the opportunity to thanks the Lovely Professional University which helped me and guided me to learn more about the very important Python Programming Language and its application towards GUI, File handling system etc, and also to different platforms which provide me the path for learning.

At last but not the least I want to thanks my friends, classmates and colleagues who help me in completing this Project on “Shop Billing Application” and for encouraging me for do this types of useful project to boost my knowledge. I have no valuable words to express my thanks but my heart is full of all the favours received from every person.

**Sudeep Kumar,Mohammad Musheer Anwar,Harsh Mittal**

## Introduction To Project

This project is under the course code of INT 213 (Python Programming) offered by lovely professional University . This project deals with the application of Graphical User Interface modules available in python library to built a model of desktop application for the shop billing purposes.

In this project we will learn to apply the knowledge of the GUI ( Graphical User Interface) with the help of python programming language. We are going to use “Tkinter” module to use all the needed functionality for the project. We are also going to use one extra module library called “pillow” as PIL to insert the image as background in our interface. We are going to use several widgets available in the “Tkinter” library in making the GUI for this project some of them like Label, Frames, entry boxes, search boxes , buttons , radio buttons etc. We are going to provide proper functioning to all the widgets to make our project executable upto a basic level and make it user friendly.

Now, as we are creating the shop billing desktop application we have to create multiples modules for proper functioning and that’s exactly what we do. Here we create several modules like login page , forgot password, as seller window and as purchaser window. Here we have 2 options first is as seller login and second is as purchaser login both are different as we can see. There is a complete portal of seller window where the buyer can buy the items selection from a particular selection area and choose all the product in the selection in the same way there is a as purchaser window where the shop owner can take care of stock in the shop so by purchaser window they can buy stock from different whole sellers and maintain their stock.

Further, There is also the functionality of bill formation in which for the every transaction made a bill can be generated to track the record of all the selling as well as buying process which can be possible. The bill contains several information and it is possible to use that bill for future reference if needed.

For all the above mentioned purposes we are going to use editor like Visual Studio code, IDLE , Spyder, PyCharm, Jupyter notebook etc..., to code the whole application we can opt for any of the options for the editor available above its our choice. The whole detailed function and application of this project is mentioned in the later section where one can see the proper implementation of the making and functioning process and have some more ideas about the project.

## Review of Literature

### Objective and research gaps

Here we are going to take a short review about the project and see what can be done more in the future for making it more attractive and advanced. In upcoming section we will discuss the detailed description of the implementation and execution. The objective of this project is the learn how to use GUI knowledge to make a desktop application and make use aware of the concepts of the GUI and File Handling , by making this project we have gained a clarity of concepts and looking forward to implement it in more effective way by learning from our first attempt. The scope of the project is vey big we can do a lot more in this project by adding many more functionalities in it like we can connect the bill formation to the email so that the bill will be generated and sent automatically to the user or we can add the whole transaction process to pay the amount like we can use different function like internet banking, Cash, Google Pay, Phone Pay , Card payments like credit card and debit card to make to easy for the user. We can also make our project deployable in the form of ”\_name\_.exe” file so that it can be installed in other systems too and user can use it.

### Project contributions

This project is been done by our group members named, Sudeep Kumar, Mohammad Musheer Anwar and Harsh Mittal .The contribution of all the three members played a important role in completion of this project everyone role is just difficult to explain .Very briefly Harsh Mittal has done the parts of login and forgot password window and also provide us data to be used, Mohammad Musheer Anwar took care of the seller module completely and Sudeep Kumar is responsible for the functioning of the Purchaser module.

### Materials And Methods

Here we had done whole project in the python programming language with version of python 3 using “tkinter” library we can use one of some basic editor available in this project listed below:

- Visual Studio Code
- Py Charm
- Spyder
- Jupyter Notebook
- IDLE

We followed object oriented methods or approach in this project we create different classes to implement the whole project as it gave us the distinction between different modules and we suppose it will be easy for us. Now in coming section we will discuss the complete detail implementation of the project module by module.

## Module 1: Login Page

The module 1 is all focused about login page where make the GUI of the login pages using widgets of the “tkinter” library.

### Window

Window is the main thing which get generated while using the tkinter it is the most basic element and all the functionality we do is under that specific window.

At first we made a wide window of tkinter of size "1500x800" and we give a background picture there . Then there is a frame which contains all the needed information of the login page like user id , user password, etc. the section of code is as below.

```
Login_page.py
1
2 from tkinter import *
3 from tkinter import font
4 from tkinter import messagebox
5 from PIL import ImageTk, Image
6
7 class Login:
8
9     def __init__(self, root):
10         self.root = root
11         self.root.title("Shop Billing Software")
12
13         # geometry (axb)+distance from x +distance from y
14         self.root.geometry("1500x800")
15
16         # resizable = it takes width and height boolean Value
17         self.root.resizable(True, True)
18
19         # =====bg image insert and resize =====
20         self.img = Image.open("login.jpg")
21
22         # resize(width,height)
23         self.resized = self.img.resize((1800, 900))
24         self.bg = ImageTk.PhotoImage(self.resized)
25         self.bg_image = Label(self.root, image=self.bg).place(x=0, y=0, relheight=1, relwidth=1)
26
```

Fig 1.01

### Frame

Frame is a type of widget we use to creating a space where we can do specific functioning it is used when we want a certain portion of the screen for a specific purposes in this case we are using it for login method purposes.

Inside the frame we used the label widgets of the “tkinter” library to show the command like login, username and user password there , label widget is used to show any text or entry in the tkinter GUI. The we also use radio button to provide the choice for the user to select one of the choice from the as purchaser and as seller. Then there is entry boxes widget

where the user can able to enter the inputs they want and button widgets to make it functioning. Buttons widgets used to provide the functioning in the GUI like what happen if this button is being clicked. All the functioning are also connected as per the inputs there and we also use different attributes under certain widgets like place,bg,fg etc to make it right .the sectional code are mentioned below.

```

self.Frame_login=Frame(self.root,bd=8,background="white",relief=GROOVE)
self.Frame_login.place(x=70,y=280,height=350,width=500)
self.var=IntVar()

self.login=Label(self.Frame_login,text="Login",font=("Forte",35,"bold"),bg="white",fg="black").place(x=50,y=20)
self.rad_1=Radiobutton(self.Frame_login,text="As Seller",height=1,width=10,font=("Aparajita",17,"bold"),bg="white",fg="brown",
variable=self.var,value=1).place(x=30,y=100)
self.rad_2=Radiobutton(self.Frame_login,text="As Purchaser",height=1,width=10,font=("Aparajita",17,"bold"),bg="white",fg="brown",
variable=self.var,value=2).place(x=170,y=100)

self.username_value=StringVar()
self.username=Label(self.Frame_login,text="Username",font=("Comic Sans MS",13,"bold"),bg="white",fg="black").place(x=50,y=140)
self.user_entry=Entry(self.Frame_login,font=("Aparajita",15,"bold"),bg="lightgrey",textvariable=self.username_value,relief=RIDGE).place
(x=50,y=180,width=350,height=35)

self.user_paasword_value=StringVar()
self.paasword=Label(self.Frame_login,text="Paasword",font=("Comic Sans MS",13,"bold"),bg="white",fg="black").place(x=50,y=220)
self.user_paasword=Entry(self.Frame_login,font=("Aparajita",15,"bold"),bg="lightgrey",textvariable=self.user_paasword_value,relief=RIDGE)
.place(x=50,y=250,width=350,height=35)

self.forget_paasword=Button(self.Frame_login,text="Forgot Paasword?",bg="white",fg="brown",font=("Arial Nova",10,"bold"),bd=0,
command=self.forgotpaasword).place(x=50,y=290)
self.login_button=Button(self.root,text="Login",bg="white",fg="brown",font=("Arial Black",15),bd=4,command=self.login_function,
relief=RAISED,background="lightyellow").place(x=218,y=610,height=38,width=200)

```

Fig 1.02

Here we also implement the functionality for the login button. We took care of the all possibilities there and use message boxes to show the desired message as per the input of the user like input the user name , password not correct, please select the user type etc.The sectional code is as below:

```

def login_function(self):
    if self.var.get()==1:
        if (self.username_value.get()==" " or self.user_paasword_value.get()==""):
            messagebox.showerror("Error", "All fields are required",parent=self.root)
        elif self.username_value.get()=="Sudeep_seller_1999" and self.user_paasword_value.get()=="Sudeepkr@1999":
            messagebox.showinfo("Welcome", "welcome Mr.Sudeep Kumar",parent=self.root)
        else:
            messagebox.showwarning("Warning", "Incorrect Username or Paasword",parent=self.root)

    elif self.var.get()==2:
        if self.username_value.get()==" " or self.user_paasword_value.get()=="":
            messagebox.showerror("Error", "All fields are required",parent=self.root)
        elif self.username_value.get()=="Sudeep_purchaser_1999" and self.user_paasword_value.get()=="Sudeepkr@1999":
            messagebox.showinfo("Welcome", "welcome Mr.Sudeep Kumar",parent=self.root)
        else:
            messagebox.showwarning("Warning", "Incorrect Username or Paasword",parent=self.root)
    else:
        messagebox.showerror("Error", "User type not selected")

```

Fig 1.03

Here as we go through the sectional code we can see the inbuilt user name and password for every user type if user enter the correct inputs it will work properly else show the desired messages.

The full screen output of the login page is there in the next page to demonstrate the functioning of the login page.

Fig 1.04( Basic Window)

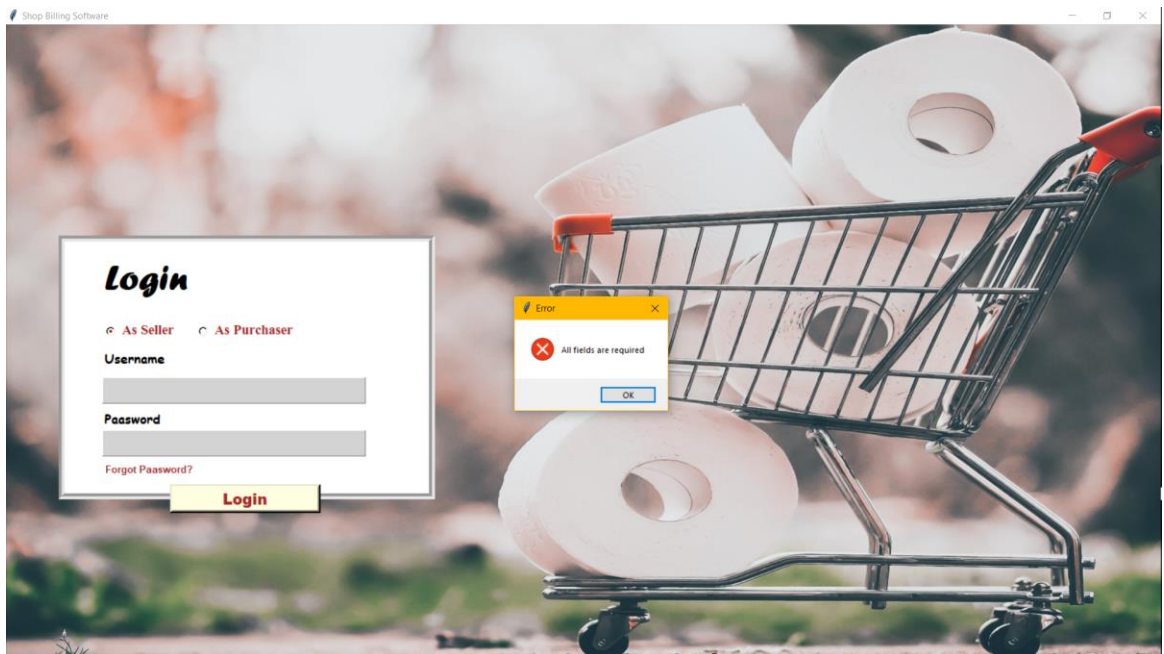

Fig 1.05( Window with Error)

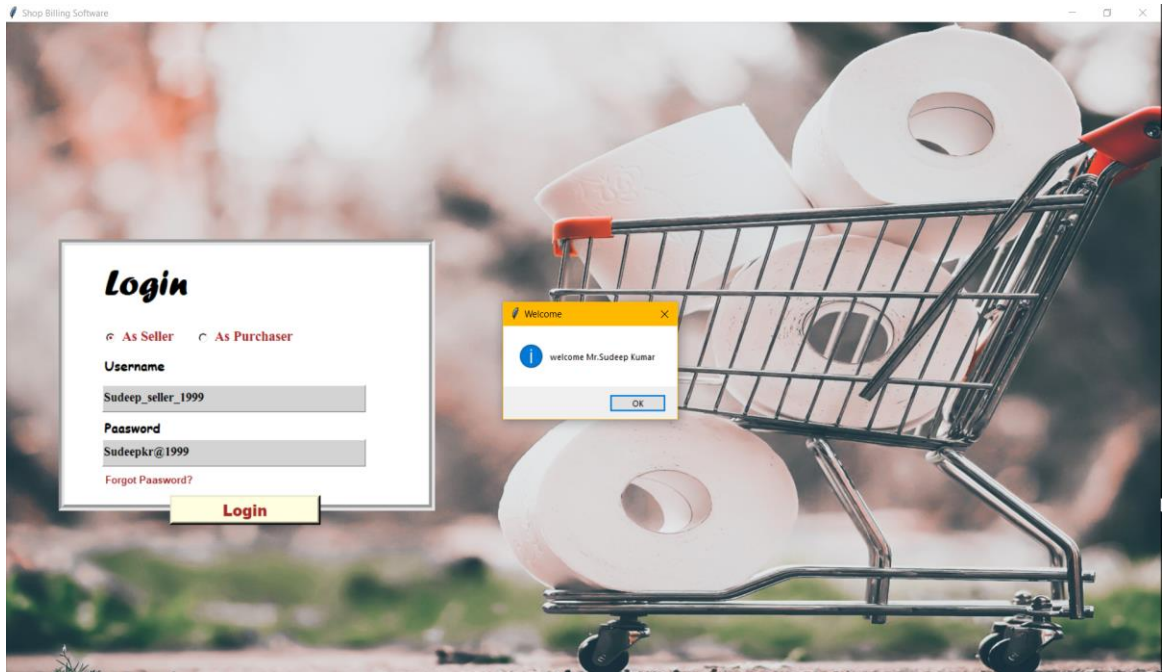

Fig 1.06(Login Confirmation with as seller)

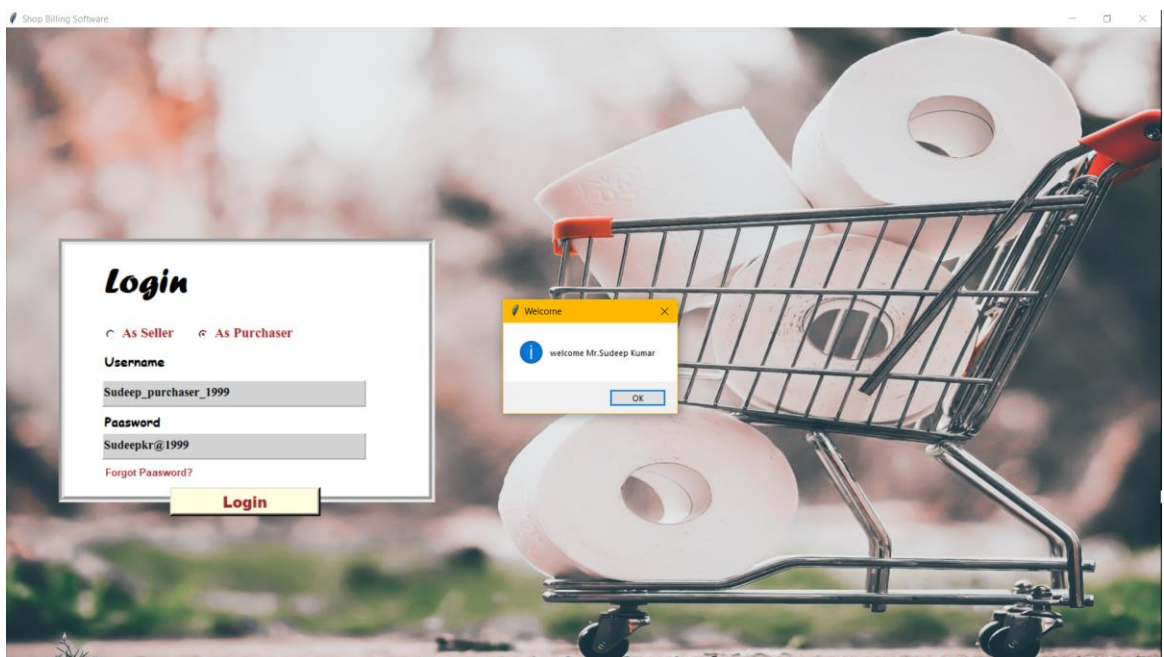

Fig 1.07(Login Confirmation with as purchaser)

There are other more message boxes but for different errors are also taken care of but for the reference one is being placed here. Here we use number of attribute in different widgets like bg, fg, font, width, height, place ,grid, pack etc ....and we also declare the variable to save the input entered from the user as specified in the code!.they are very useful to make the GUI interface one can go through the code snaps here to see how we use this attributes and for function calling through buttons or other widgets we use “command= function\_name” to call . Now in next chapter we discuss the functioning of the forgot password page.

## Module 2: Forgot Password Page

The forgot password window is one in which we can change our password by validating some of our profile details here we create the forgot password window by using “tkinter” GUI of size “500x300” which is static means we cannot change the size and orientation of the window. In this GUI window we put a frame again of similar size and inside the frame we can do the other stuffs .The sectional code for the gui window is as follow:

```

ForgotWindow.py > ForgotPaasword > _init_
1  from tkinter import *
2  from tkinter import Frame
3  from PIL import Image,ImageTk
4
5
6  class ForgotPaasword:
7  def __init__(self,root):
8      self.root_1=root
9      self.bgcolor = "#074463"
10     self.bgcolor6 = "#074463"
11     self.bgcolor1 = "grey"
12     self.bgcolor2 = "#ECF0F1"
13     self.bgcolor3 = "#A1F9F8"
14     self.bgcolor4 = "white"
15     self.bgcolor5 = "#A4F5F4"
16
17     self.root_1.geometry("500x350+500+280")
18     self.root_1.resizable(False,False)
19     self.root_1.title("Forgot Paasword Window")
20     self.background=Label(self.root_1,bg=self.bgcolor1,bd=15,height=350,width=500,relief=GROOVE).place(x=0,y=0,relheight=1,relwidth=1)

```

Fig 2.01

Now when we make a frame, inside the frame we give all the labels like , to show that it is a forgot password window we use the label “forgot password window” and again we use username , new password and confirm new password as the label and we give a text entry boxes widgets corresponding to each of the labels, where the user can enter the input specified. We use 2 buttons “Save” and “Cancel” to implement the functioning if we click save the new password should save and cancel will cancel all the process. For this we implement different function and by using “command” attribute in button we can able to use this function in our GUI . The sectional code snap is as below:

```

self.forgot_frame=Frame(self.root_1,bd=10,background="white",relief=RIDGE,bg="lightgrey").place(x=40,y=45,height=250,width=420)
self.heading=Label(self.root_1,text="Forgot Paasword",font=("Forte",20,"bold"),bg="lightgrey",fg="brown").place(x=60,y=60)

self.user_name_new=StringVar()
self.ask_user_id=Label(self.root_1,text="Enter Username",font=("Comic Sans MS",13,"bold"),bg="lightgrey",fg="black").place(x=60,y=90)
self.user_new_entry=Entry(self.root_1,font=("Aparajita",12,"bold"),bg="white",textvariable=self.user_name_new,relief=RIDGE).place(x=60,y=120,width=280,height=25)

self.user_new_paasword=StringVar()
self.ask_new_paasword=Label(self.root_1,text="Enter new Paasword",font=("Comic Sans MS",13,"bold"),bg="lightgrey",fg="black").place(x=60,y=150)
self.user_new_entry_1=Entry(self.root_1,font=("Aparajita",12,"bold"),bg="white",textvariable=self.user_new_paasword,relief=RIDGE).place(x=60,y=180,width=280,height=25)

self.user_confirm_new_paasword=StringVar()
self.confirm_new_paasword=Label(self.root_1,text="Confirm new Paasword",font=("Comic Sans MS",13,"bold"),bg="lightgrey",fg="black").place(x=60,y=210)
self.user_new_entry_2=Entry(self.root_1,font=("Aparajita",12,"bold"),bg="white",textvariable=self.user_confirm_new_paasword,relief=RIDGE).place(x=60,y=240,width=280,height=25)

self.submit_button=Button(self.root_1,text="Save",fg="black",font=("Aparajita",14,"bold"),bd=4,relief=RAISED,background="lightyellow").place(x=364,y=150,height=35,width=80)
self.cancel_button=Button(self.root_1,text="Cancel",fg="black",font=("Aparajita",14,"bold"),bd=4,relief=RAISED,background="lightyellow").place(x=364,y=200,height=35,width=80)

```

Fig 2.02

Here as we can see in the above snap there are variables we used to save the inputs given by the user there in the StringVar() variables so that it can be take in utilization in the further operations.

The final output screen is shown below:

Fig 2.03

This is the final output screen which allow user to do further implementations. Now further we are going to discuss the module 3 that is as purchaser window.

## Module 3: Purchaser Window

Now here we are in module 3 where we discuss what was done to make the purchaser window. Now as the purchaser window is bit complex and have many sections we will discuss it by dividing it into small-small sections as mentioned below:

- Wholeseller Details
- Items Categories
- Categories window
- Billing Area
- Bill menu
- Operations buttons section

Now we will discuss the above sections one by one:

### ❖ Wholeseller Details

In wholeseller details we are going to get 3 values first is wholeseller name , second is wholeseller contact number and the third is the bill number here bill number is used to search the bill for further uses once it is generated. There are 6 wholeseller options available here as for one whole seller for one categories of items( born baby, mens wear, women's wear, electronics, kitchen utensis and for stationary) below is the snap of that frame.

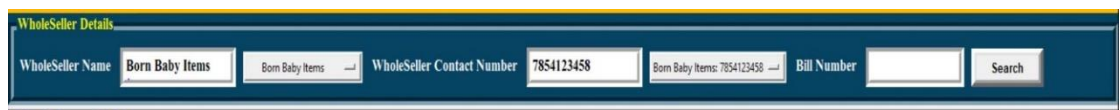

Fig 3.01

Here in the above frame the whole seller details are to be recorded.

### ❖ Item categories

Here in the item categories we divide it into 6 parts as mentioned below:

1. Born baby items
2. Men's wear items
3. Women's wear items
4. Kitchen utensils
5. Electronic items
6. Stationary items

In the item categories user is allowed to select one of the categories as per their choice selecting the choice from the radio buttons corresponding to each items available there.

The snap of the item categories window is shown below:

Fig 3.02

Here is the item categories frame from where the user can choice its choices.

### ❖ Categories window

In categories window we have the items corresponding to each categories mentioned above and the user can select their choices as per their wish by just going through some dropdown boxes and selecting the options and by entering the quantity they want . There is one confirm button in front of each and every until unless the user is not pressing that confirm buttons the selection would not be granted this is done to ensure complete freedom to the user to select and think as many as times before finalizing the items to be selected. Below is the category window of all 6 categories with explanation.

#### Born baby category window

Born Baby				
Items	Size	Price	Quantity	Confirmation
Shirts	Select the size ▾	Select the Price ▾	0	Confirm
Jeans	Select the size ▾	Select the Price ▾	0	Confirm
Shoes	Select the size ▾	Select the Price ▾	0	Confirm
Frock	Select the size ▾	Select the Price ▾	0	Confirm
T-Shirts	Select the size ▾	Select the Price ▾	0	Confirm
Pants	Select the size ▾	Select the Price ▾	0	Confirm
Sweater	Select the size ▾	Select the Price ▾	0	Confirm
Jackets	Select the size ▾	Select the Price ▾	0	Confirm
Baby Caps	Select the size ▾	Select the Price ▾	0	Confirm
Shocks	Select the size ▾	Select the Price ▾	0	Confirm

Fig 3.03

This is the born baby category window from which the user can select the item as per their need and the confirm button is also there for confirmation as mentioned above.

Here we have set of items from which user can select the choices , the details of this options like size price and quantity is available in the table section in the later part of the report.

### Men's Wear Category window

Men's Wear Items				
Items	Size	Price	Quantity	Confirmation
Formal Shirts	Select the size	Select the Price	0	Confirm
T-Shirts	Select the size	Select the Price	0	Confirm
Formal Pants	Select the size	Select the Price	0	Confirm
Jeans	Select the size	Select the Price	0	Confirm
Coats	Select the size	Select the Price	0	Confirm
Hoodies	Select the size	Select the Price	0	Confirm
Jackets	Select the size	Select the Price	0	Confirm
Sweaters	Select the size	Select the Price	0	Confirm
Shoes	Select the size	Select the Price	0	Confirm
Kurtas	Select the size	Select the Price	0	Confirm

Fig 3.04

This is the Men's Wear category window from which the user can select the item as per their need and the confirm button is also there for confirmation as mentioned above.

Here we have set of items from which user can select the choices, the details of this options like size price and quantity is available in the table section in the later part of the report.

### Women's Wear Category window

Women's Wear Items				
Items	Size	Price	Quantity	Confirmation
Kurta Sets	Select the size	Select the Price	0	Confirm
Jeans	Select the size	Select the Price	0	Confirm
T-Shirts	Select the size	Select the Price	0	Confirm
Jackets	Select the size	Select the Price	0	Confirm
Dresses	Select the size	Select the Price	0	Confirm
Shoes	Select the size	Select the Price	0	Confirm
Kafri Gowns	Select the size	Select the Price	0	Confirm
Leggings	Select the size	Select the Price	0	Confirm
Scarfs	Select the size	Select the Price	0	Confirm
Skirts	Select the size	Select the Price	0	Confirm

Fig 3.05

This is the Women's Wear category window from which the user can select the item as per their need and the confirm button is also there for confirmation as mentioned above.

Here we have set of items from which user can select the choices , the details of this options like size price and quantity is available in the table section in the later part of the report.

### Kitchen Utensils Category Window

Kitchen Utensils Items				
Items	Company	Price	Quantity	Confirmation
Pressure Cooker	Select the company	Select the Price	0	Confirm
Induction	Select the company	Select the Price	0	Confirm
Mixer Grinder	Select the company	Select the Price	0	Confirm
Micro Oven	Select the company	Select the Price	0	Confirm
Dinner Set	Select the company	Select the Price	0	Confirm
Utensils Stand	Select the company	Select the Price	0	Confirm
Frying Pan	Select the company	Select the Price	0	Confirm
Spoon Set	Select the company	Select the Price	0	Confirm

Marker Pens	Select the company	Select the Price	0	Confirm

Fig 3.08

This is the Stationary Items category window from which the user can select the item as per their need and the confirm button is also there for confirmation as mentioned above.

Here we have set of items from which user can select the choices , the details of this options like company, price and quantity is available in the table section in the later part of the report.

### ❖ Billing Area

Now after categories window here we are with billing area where the bill is being show after generation or on searching after the user click the generate bill the bill there would be seen. For billing area we use textarea widget of “tkinter” and we write all the messages there and use file handling to save the bill in “.txt” format separately for purchaser bill and user bill in different directories.

The snap of the billing area with the sample bill is shown as below:

The screenshot shows a Tkinter window titled "Billing Area". Inside the window, there is a text area containing a sample bill. The bill starts with a welcome message "Welcome To M.H.S Store". It then lists bill details: Bill No : 4412, Wholeseller Name : Born Baby Items, Wholeseller Contact Number : 7854123458, Billing Address : LPU, Wholeseller Email : sudeep@gmail.com, and Payment Mode : Online. Below this, there is a table with four columns: Product, Size, Quantity, and Price. The table lists various items like Shirt, Jeans, Shoes, Frock, T-Shirts, Pants, Sweater, Jacket, Baby Caps, and Shocks with their respective sizes, quantities, and prices. At the bottom of the table, the Total Amount is calculated as 11250.

Product	Size	Quantity	Price
Shirt	Small	2	500
Jeans	Medium	5	1250
Shoes	Size 1	7	1750
Frock	Medium	1	800
T-Shirts	Medium	8	4000
Pants	Small	1	250
Sweater	Small	1	500
Jacket	Small	5	1250
Baby Caps	Small	1	200
Shocks	Small	5	750
Total Amount :			11250

Fig 3.09

This is the sample bill which we can find once it is generated or searched.

### ❖ Bill Menu

The bill menu contains the record of the total amount of the different categories of things that we saw in the above sections. As we select the items from the categories form the item list the amount in the bill menu get updated corresponding to the categories which we have selected and as long as we continue selecting the items the amount will sum up to show final amount. There is also a specific entry of billing address, whole seller e-mail and payment mode which we have to select or give the input for the purpose of giving the data in bill generation. This whole data will be present there in the bill which will be generated. The below image show the window of the bill menu present in the GUI.

The screenshot shows a window titled "Bill Menu" with a dark blue header. Below the header, there are several input fields arranged in a grid. The first column contains three labels: "Total Born Baby Price", "Total Mens Wear Price", and "Total Womens Wear Price", each followed by a text box containing the number "0". The second column contains three labels: "Total Kitchen Utensils Price", "Total Electronics Price", and "Total Stationary Price", each followed by a text box containing the number "0". To the right of these columns are three more input fields: "Billing\_Address", "WholeSeller Email", and "Payment Mode". The "Payment Mode" field has a dropdown arrow next to it, and the text "Select Payment Mode" is visible below it.

Fig 3.10

### ❖ Operations Button section

This section contains the 4 button namely Total, Generate Bill, Clear and Exit. All of the above mentioned button are important Total button is for checking the total upto a certain instance of selection of items means in between selecting the items if we want to check the total amount till then we can check it by clicking it the total button. The generate bill button is used to generate the bill as we click the generate bill button it will show the bill in the billing area and ask whether we want to save the bill on not? If yes then the bill will be saved by its bill number in the specified folder and can be accessed later if needed. The clear button is there to clear the interface or we can say renew the interface if we give permission to the clear button it will undo all the changes which is being made till then and make the interface completely new to perform. And finally there is exit button which we use to exit the interface with giving the permission to it.

Here is the image of the section of buttons shown below:

Fig 3.11

Now as we discussed all the aspect of the as purchaser menu here is the final interface image which is going to be displayed as whole and we are going to execute all the above sections in that very interface.

## Module 4: Seller Window

Here we are in module 4, where we discuss what was done to make the Seller window. Now as the seller window have many sections we will discuss it by dividing it into small-small sections as mentioned below:

- Customer Details
- Items Categories
- Categories window
- Billing Area
- Bill menu
- Operations buttons section

### ❖ Customers Details

In customer details we are going to get 3 values first is customer name , second is customer contact number and the third is the bill number here bill number is used to search the bill for further uses once it is generated. There are 6 options available here as for every customer categories of items( born baby, mens wear, women's wear, electronics, kitchen utensils and for stationary) below is the snap of that frame.

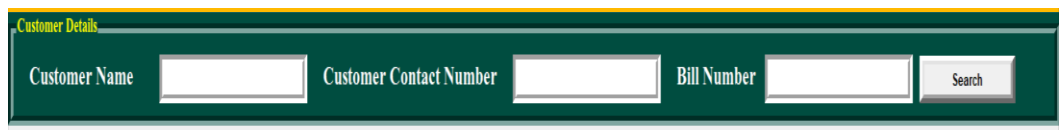

Fig 4.01

### ❖ Item categories

Here in the item categories we divide it into 6 parts as mentioned below:

- 1.Born baby items
- 2.Men's wear items
- 3.Women's wear items
- 4.Kitchen utensils
- 5.Electronic items
- 6.Stationary items

In the item categories user is allowed to select one of the categories as per their choice selecting the choice from the radio buttons corresponding to each items available there.

The snap of the item categories window is shown below:

Fig 4.02

### ❖ Categories window

In categories window we have the items corresponding to each categories mentioned above and the user can select their choices as per their wish by just going through some dropdown boxes and selecting the options and by entering the quantity they want . There is one confirm button in front of each and every until unless the user is not pressing that confirm buttons the selection would not be granted this is done to ensure complete freedom to the user to select and think as many as times before finalizing the items to be selected. Below is the category window of all 6 categories with explanation.

#### Born baby category window

Born Baby				
Items	Size	Price	Quantity	Confirmation
Shirts	Select the size ▾	Select the Price ▾	0	Confirm
Jeans	Select the size ▾	Select the Price ▾	0	Confirm
Shoes	Select the size ▾	Select the Price ▾	0	Confirm
Frock	Select the size ▾	Select the Price ▾	0	Confirm
T-Shirts	Select the size ▾	Select the Price ▾	0	Confirm
Pants	Select the size ▾	Select the Price ▾	0	Confirm
Sweater	Select the size ▾	Select the Price ▾	0	Confirm
Jackets	Select the size ▾	Select the Price ▾	0	Confirm
Baby Caps	Select the size ▾	Select the Price ▾	0	Confirm
Shocks	Select the size ▾	Select the Price ▾	0	Confirm

Fig 4.03

This is the born baby category window from which the user can select the item as per their need and the confirm button is also there for confirmation as mentioned above.

Here we have set of items from which user can select the choices , the details of this options like size price and quantity is available in the table section in the later part of the report.

## Men's Wear Category window

Men's Wear Items				
Items	Size	Price	Quantity	Confirmation
Formal Shirts	Select the size <input type="text"/>	Select the Price <input type="text"/>	0 <input type="text"/>	Confirm

Formal Shirts	M	2	1600
T-Shirts	XL	1	800
Formal Pants	Size 32	5	2500
Total Amount : 4900			

Fig 4.09

This is the sample bill which we can find once it is generated or searched.

#### ❖ Bill Menu

The bill menu contains the record of the total amount of the different categories of things that we saw in the above sections. As we select the items from the categories form the item list the amount in the bill menu get updated corresponding to the categories which we have selected and as long as we continue selecting the items the amount will sum up to show final amount. There is also a specific entry of billing address, Customer e-mail and payment mode which we have to select or give the input for the purpose of giving the data in bill generation. This whole data will be present there in the bill which will be generated. The below image show the window of the bill menu present in the GUI.

**Bill Menu**

Total Born Baby Price	0	Total Kitchen Utensils Price	0	Billing_Address	<input type="text"/>
Total Mens Wear Price	0	Total Electronics Price	0	Customer Email	<input type="text"/>
Total Womens Wear Price	0	Total Stationary Price	0	Payment Mode	Select Payment Mode <input type="button" value="..."/>

Fig 3.10

### ❖ **Operations Button section**

This section contains the 4 button namely Total, Generate Bill, Clear and Exit. All of the above mentioned button are important Total button is for checking the total upto a certain instance of selection of items means in between selecting the items if we want to check the total amount till then we can check it by clicking it the total button. The generate bill button is used to generate the bill as we click the generate bill button it will show the bill in the billing area and ask whether we want to save the bill on not? If yes then the bill will be saved by its bill number in the specified folder and can be accessed later if needed. The clear button is there to clear the interface or we can say renew the interface if we give permission to the clear button it will undo all the changes which is being made till then and make the interface completely new to perform. And finally there is exit button which we use to exit the interface with giving the permission to it.

Here is the image of the section of buttons shown below:

## Conclusion

In the process of making this project (BILLING SYSTEM), we came across many new things like usage of Tkinter library for GUI. Inside this library, we came across many different functions like:-

1. Labels
2. Entry box
3. Creating different Frames
4. Buttons
5. Radio Buttons
6. Check Box
7. Scroll Bar
8. Message Box
9. Fonts etc.

In this GUI application, we can login as Seller or Purchaser both. After login, we have to mention or choose from the given option the wholeseller name, their Mob.no and also bill number. After that we have the Items Categories option in which mainly six different categories were given i.e: born baby, mans wear etc as mention above.

Then we have ten different available items for every category, along with the necessary details like MRPs, size, color, company etc. We can select the items according to our need.

After selecting the items, MRPs, company etc, then we also create the bill with proper details in it i.e: Seller name, contact no, date, total amount, no of items, cost of each item etc, so to make it possible to fetch it for the further future uses as per need.

After that it shows the message of conformation for generating the bill and there are cancel option also. We can also search the old bill by entering the bill no.

This project helped us to know about the new libraries here it is “tkinter” and it teaches us upto that extent that we are able to make projects like that in the coming future.

Above is all the references of the web links we go through to make this project possible upto the best we can. That's all for this project we are seeking to learn more and more about this in coming future.
